

Solar PV Shade Evaluation Procedure

.....

A method to determine Shade Factor

24 ABOUT MCS

25 **Giving you confidence in home-grown energy**

26 With energy costs constantly rising and climate change affecting us all, low-carbon technology
27 has a bigger and bigger role to play in the future of UK energy.

28 We're here to ensure it's a positive one.

29 Working with industry we define, maintain and improve quality – certifying products and
30 installers so people can have confidence in the low-carbon technology they invest in. From
31 solar and wind, to heat pumps, biomass and battery storage, we want to inspire a new
32 generation of home-grown energy, fit for the needs of every UK home and community.

33 About

34 The Microgeneration Certification Scheme Service Company Ltd (MCSSCo Ltd) trades as
35 MCS and is wholly owned by the non-profit MCS Charitable Foundation. Since 2007, MCS has
36 become the recognised Standard for UK products and their installation in the small-scale
37 renewables sector.

38 We create and maintain standards that allow for the certification of products, installers and
39 their installations. Associated with these standards is the certification scheme, run on behalf of
40 MCS by Certification Bodies who hold UKAS accreditation to ISO 17065.

41 MCS certifies low-carbon products and installations used to produce electricity and heat from
42 renewable sources. It is a mark of quality. Membership of MCS demonstrates adherence to
43 these recognised industry standards; highlighting quality, competency and compliance.

44 Vision

45 To see MCS certified products and installations in every UK home and community.

46 Mission

47 To give people confidence in low-carbon energy technology by defining, maintaining and
48 improving quality.

49 Values

- 50 1. We are expert – ensuring quality through robust technical knowledge
- 51 2. We are inspiring – helping to reshape energy in UK homes and communities
- 52 3. We are collaborative – working with industry and government to create positive change
- 53 4. We are principled – operating in a way that's clear, open and fair
- 54 5. We are determined – supporting the UK's drive towards a clean energy future

56 Solar PV Shade Evaluation Procedure 1

57 About MCS 3

58 Table of Contents 4

59 1 Introduction & Purpose 5

60 2 Shade Evaluation Procedure 6

61 2.1 Objects further than 10m 6

62 2.2 Objects at, or less than, 10m 8

63 Appendix A – Shade assessment tools 10

64 Appendix B – Sunpath Diagram 11

65

66 **1 INTRODUCTION & PURPOSE**

67 This is a guidance document. It is neither a mandatory MCS requirement, nor contains
68 mandatory requirements, unless expressly stated as such in an MCS installation standard (MIS)
69 using the words “should” or “shall” in the reference to MGD 005 or its clauses.

70 The purpose of this document is to describe a procedure to assess the potential impact of
71 shading on a solar Photovoltaic array as a result of both near and far objects. The result is a
72 shade factor (SF) which can be used to modify the amount of electricity that it is predicted
73 might be generated by a proposed solar photovoltaic (PV) system.

74 This procedure has been designed to provide a simplified and standardised approach for MCS
75 contractors to use when estimating the impact of shade on system performance. It is not
76 intended to be as accurate as more sophisticated methods such as, for example, those included
77 in proprietary software packages. It is estimated that this shade assessment method will yield
78 results within 10% of the actual annual energy yield for most systems. Unusual systems or
79 environments may produce different results.

80 Where the proposed location for the PV array is subject to significant shading from numerous
81 objects, and making assessment difficult, then installation in that location may simply not be
82 appropriate and the customer should be advised. Near shading especially will have a
83 considerable effect on system performance and should be avoided. Solar PV systems should
84 not be sold where the impact of shade could be severe.

85 **HEALTH WARNING**

86 The method implies the need to undertake assessment at height which can be very
87 dangerous. In most cases it should be possible to follow the method without climbing on
88 roofs provided you can be confident the result is representative.

89 Where users of this method decide working at height is necessary then all appropriate
90 precautions should be taken to reduce the risk of death or injury from falling.

92 2 SHADE EVALUATION PROCEDURE

93 Where there is a potential for shading from objects further than 10m away from the centre
94 midpoint of the array then the procedure given in clause 2.1 shall be used.

95 Where there are objects at or less than 10m away (near shade) from the centre midpoint of the
96 array then the procedure stated in clause 2.2 shall be used.

97 Assessment shall be undertaken and recorded using the Sunpath chart given in Appendix B to
98 represent the potential irradiance which could be blocked by objects on the horizon at differing
99 times of the day and of the year (as indicated by the different arcs).

100 *Note: where manipulating or drawing on the Sunpath chart on a computer it is important the*
101 *proportions of the chart are not distorted.*

102 **2.1 OBJECTS FURTHER THAN 10M**

103 Principles

104 The chart has a total of 84
105 segments each of which has a
106 value of 0.01.

107 By marking objects on the
108 horizon according to their height
109 and orientation in relation to the
110 proposed array the segments
111 that are touched are then
112 counted to derive the Shade
113 Factor

114 Location

115 Stand as near as possible to the base and centre of the proposed array, e.g. through an upstairs
116 window, unless there is shading from objects within 10m (e.g. aerials, chimneys, etc.) in which
117 case follow the procedure given later.

118 Tools

119 As a minimum the tools required to undertake this analysis are a compass and a device to
120 measure the elevation of obstacles on the horizon such as an inclinometer.

121 Other more sophisticated tools can be used, and a selection are discussed in Appendix A

122 Detailed Method

Figure 1: Sunpath chart showing segments

123 Looking due South (irrespective
 124 of the orientation of the array),
 125 draw a line showing the
 126 uppermost edge of any objects
 127 that are visible on the horizon
 128 (either near or far) onto the
 129 Sunpath chart.

Figure 2: Sunpath Chart with object on the horizon

130 This line is called the “horizon
 131 line”, an example of which is
 132 shown here:

133 Once the horizon line has been drawn, the number of segments that have been touched by the
 134 line, or that fall under the horizon line shall be counted, in the following example you can see
 135 there are 11 segments covered or touched by the horizon line.

136

137

Figure 3: Sunpath chart showing segments affected and counted

138 In Figure 3 the total number of affected segments is 11. This number is then multiplied by their
 139 value for each segment (0.01) and the total deducted from 1 to arrive at the Shading Factor (SF)
 140 for the proposed installation. In this example the shading factor is calculated as follows:

142

$$1 - (11 \times 0.01) = 1 - 0.11 = 0.89$$

143 Notes:

144 *Printing the Sunpath chart onto paper to hold at arm's length and sketching the horizon will*
 145 *not produce a valid result.*

146 *For systems connected to module level optimisers, multiple inverters, or a single inverter with*
147 *multiple independent maximum power-point trackers (MPPT), it is acceptable to do a separate*
148 *calculation of SF for each sub array (each array connected to a dedicated MPPT).*

149 **2.2 OBJECTS AT, OR LESS THAN, 10M**

150 Principles

151 Shading from objects close to the array (for example: vent pipes, chimneys, and satellite dishes
152 located to the East, South, or West) can have a very significant impact on the performance of
153 PV systems. This is because near objects cast larger shadows, and for more hours of the day,
154 than objects further away. Objects located behind the proposed array (e.g. to the North) do not
155 need to be considered as they will cast little, if any, shadow.

156 To reflect this greater impact the method counts all segments affected within a circle with a
157 radius equal to the height of any object casting a shadow.

158 Where such shading is apparent, it is strongly recommended that either the array should be
159 repositioned away from the objects casting a shadow, or the object(s) casting the shadow
160 should be removed altogether. Then there would be no need to use this method.

161 A further option would be to perform a series of calculations and measurements that would allow
162 you to create a chart representative of the shadows cast by objects.

163 Where the installation is still to proceed, and **only when all other options have been**
164 **discounted**, then the following method should be used.

165 Location

166 The reading should be taken from the array location worst affected by shade. This will usually
167 mean a location just South of the object casting a shadow.

168 Tools

169 The same tools should be used as described previously. Additionally, a working platform should
170 be erected or, if a roof is to be accessed only with a ladder, then fall arrest equipment should be
171 used.

172 Detailed Method

173 Looking due South, a standard horizon line, as described in clause 2.1, should be drawn onto
174 the Sunpath chart.

175 Objects on the horizon that are 10m or closer to any part of the array, shall have a shade circle
176 added to the chart. Where there are multiple objects within 10m, then multiple circles shall be
177 drawn – one for each object.

Issue: 1.0	COPYRIGHT © The MCS Charitable Foundation 2020	MGD 005
Date: XX/XX/2020		Page 8 of 11

178 The shade circle shall have a radius equal to the height of the object. The shade circle should
 179 be located so that the apex of the circle sits on the highest point of the shade object.

180 Figure 4]; Sunpath chart showing near object, circle and segments counted

182 If the top of any object extends above the
 183 uppermost arc, which represents the
 184 Summer path of the Sun, then the apex of
 185 the circle should be located at the
 186 intersection of the object and that arc.

187 All segments touched by or within the
 188 shade circle should be counted as part of
 189 the overall shade analysis.

190 Figure 5: Object above the uppermost arc

192 In the example shown, using the same shade object as before but now assumed to be nearer
 193 than 10m, 40 segments are counted resulting in a shade factor of 0.6 (compared with 0.89
 194 before).

APPENDIX A – SHADE ASSESSMENT TOOLS

Method		Advantages	Disadvantages
	Compass & elevation tool	<ul style="list-style-type: none"> • Low cost • Readily available tools • Good for simple shade objects 	<ul style="list-style-type: none"> • Slow • Difficult for complex shade
	Reflective dome tool	<ul style="list-style-type: none"> • Good visualisation of shade • Quick 	<ul style="list-style-type: none"> • Needs transferring to MCS chart • Needs space to operate
	Transparent acetate tool	<ul style="list-style-type: none"> • Instant visualisation of sunpath • Quick 	<ul style="list-style-type: none"> • Lower resolution?
	Phone Apps	<ul style="list-style-type: none"> • Instant visualisation of sunpath • Quick 	<ul style="list-style-type: none"> • Checking (compass errors) • Identifying near objects • Needs transferring to MCS chart
	Camera methods	<ul style="list-style-type: none"> • Creates good record for client 	<ul style="list-style-type: none"> • Needs transferring to MCS chart
	Electronic shade analyser	<ul style="list-style-type: none"> • Quick • Accurate • Remote pole mount option 	<ul style="list-style-type: none"> • Cost
	3D modelling (a way of plotting existing data)	<ul style="list-style-type: none"> • Good for new build sites • Can animate shade travel • Can model different scenarios 	<ul style="list-style-type: none"> • Slow • Still need to collect site data • Need object heights

APPENDIX B – SUNPATH DIAGRAM
