

MCS

STANDARDS DOCUMENT

MIS 3005-D ISSUE 1.0 DRAFT

The Heat Pump Standard

(Design)

This Microgeneration Installation Standard is the property of the MCS Charitable Foundation, Innovation Centre, Sci-Tech Daresbury, Keckwick Lane, Cheshire WA4 4FS. Registered Charity No. 1165752

COPYRIGHT © The MCS Charitable Foundation 2020

This Standard was prepared by the MCS Working Group 6 'Heat Pumps'.

It is published by The MCS Service Company Ltd on behalf of the MCS Charitable Foundation.

Whilst all reasonable care has been taken in the preparation of this document it is provided on an "as is" basis without any guarantee of completeness or accuracy. The MCS Service Company Ltd and The MCS Charitable Foundation (and any related parties) do not accept liability for any errors or omissions in the document nor for the use or application of the information, standards or requirements contained in the document by any third party.

The MCS Service Company Ltd welcomes comments of a technical or editorial nature and these should be sent to meetings@mcs-certified.com

COPYRIGHT © The MCS Charitable Foundation 2020

This Standard is freely available for personal use. Commercial use by those not holding a valid licence to use the MCS mark is prohibited. In the context of this document commercial use is defined as:

- A manufacturer claiming that any of its products are certified in accordance with this document
- An installation or maintenance contractor claiming that its design, installation or maintenance services are either certified in accordance with, or compliant with, this document
- An organisation offering certification or verification services in accordance with this document

Any unauthorised reproduction, use or transmission of all or part of this document without permission is strictly prohibited.

ABOUT MCS

Giving you confidence in home-grown energy

With energy costs constantly rising and climate change affecting us all, low-carbon technology has a bigger and bigger role to play in the future of UK energy.

We're here to ensure it's a positive one.

Working with industry we define, maintain and improve quality – certifying products and installers so people can have confidence in the low-carbon technology they invest in. From solar and wind, to heat pumps, biomass and battery storage, we want to inspire a new generation of home-grown energy, fit for the needs of every UK home and community.

About

The Microgeneration Certification Scheme Service Company Ltd (MCSSCo Ltd) trades as MCS and is wholly owned by the non-profit MCS Charitable Foundation. Since 2007, MCS has become the recognised Standard for UK products and their installation in the small-scale renewables sector.

We create and maintain standards that allow for the certification of products, installers and their installations. Associated with these standards is the certification scheme, run on behalf of MCS by Certification Bodies who hold UKAS accreditation to ISO 17065.

MCS certifies low-carbon products and installations used to produce electricity and heat from renewable sources. It is a mark of quality. Membership of MCS demonstrates adherence to these recognised industry standards; highlighting quality, competency and compliance.

Vision

To see MCS certified products and installations in every UK home and community.

Mission

To give people confidence in low-carbon energy technology by defining, maintaining and improving quality.

Values

1. We are expert – ensuring quality through robust technical knowledge
2. We are inspiring – helping to reshape energy in UK homes and communities
3. We are collaborative – working with industry and government to create positive change
4. We are principled – operating in a way that's clear, open and fair
5. We are determined – supporting the UK's drive towards a clean energy future

Date: XX/XX/2020		Page 3 of 29

CHANGES TO STANDARDS

When MCS Standards are revised, the issue number is also revised to indicate the nature of the changes. This can either be a whole new issue or an amendment to the current issue. Details will be posted on the website at www.mcscertified.com

Technical or other significant changes which affect the requirements for the approval or certification of the product or service will result in a new issue. Minor or administrative changes (e.g. corrections of spelling and typographical errors, changes to address and copyright details, the addition of notes for clarification etc.) may be made as amendments.

The issue number is given on the left of the decimal point, and the amendment number on the right. For example, issue 3.2 indicates that it is the third significant version of the document which has had two sets of minor amendments.

Users of this Standard should ensure that they are using the latest issue.

Issue No.	Amendment Details	Date
1.0	First Publication	XX/XX/2020

Issue: 1.0 Draft	COPYRIGHT © The MCS Charitable Foundation 2020	MIS 3005-D
Date: XX/XX/2020		Page 4 of 29

FOREWORD

This document contains references to other documents which may be either normative or informative. At the time of publication any editions of those documents, where indicated, were valid. However, as all documents are subject to revision, any users of this document should apply the most recent editions of those referenced documents (unless a dated version is specified).

The previous issue MIS 3005 V5.0 combined Design and Installation into one Standard which are now separated into two separate versions of MIS 3005: this Standard with a "D" suffix for Design only (MIS 3005-D) and another Standard with an "I" suffix for Installation only (MIS 3005-I).

This Standard describes the MCS requirements for the assessment, approval and listing by Accredited Certification Bodies of contractors undertaking the design of heat pump systems where installation (including setting to work and commissioning) is undertaken by others. This Standard also includes requirements where contractors undertaking design also contract with customers to supply and handover a fully working system whilst subcontracting the installation.

Both documents can be used together for contractors contracting with customers to handover a fully working heat pump system (i.e. undertaking all of the supply, design, installation, set to work, commissioning and handover).

The listing and approval is based on evidence acceptable to the certification body:

- that the system or service meets the Standard
- that the contractor has staff, processes and systems in place to ensure that the system or service delivered meets the standard
- And on:
- periodic audits of the contractor including testing as appropriate
- compliance with the contract for the MCS listing and approval including agreement to rectify faults as appropriate

This Standard shall be used in conjunction with the scheme document MCS 001 and any other guidance and supplementary material available on the MCS website specifically referring to this Standard (MIS 3005-D).

NOTES:

This MCS Standard makes use of the terms 'must', 'shall' and 'should' when prescribing certain requirements and procedures. In the context of this document:

- *the term 'must' identifies a requirement by law at the time of publication;*
- *the term 'shall' prescribes a requirement or procedure that is intended to be complied with in full and without deviation;*

Issue: 1.0 Draft	COPYRIGHT © The MCS Charitable	MIS 3005-D
Date: XX/XX/2020	Foundation 2020	Page 5 of 29

- the term 'should' prescribes a requirement or procedure that is intended to be complied with unless reasonable justification can be given.

Compliance with this MCS Standard does not in itself confer immunity from legal obligations.

1 1 PURPOSE & SCOPE

2 1.1 This Standard specifies the requirements for MCS Contractors undertaking only the
3 design of microgeneration heat pump systems supplying permanent buildings with
4 space heating and/or domestic hot water.

5 1.2 Contractors can seek certification:

- 6 a) Against this Standard **and** MIS 3005-I (installations)
- 7 Or
- 8 b) Against **only** this Standard (in which case limitations apply detailed below)

9 1.3 Where the Contractor is certified against both this Standard and MIS 3005-I then all
10 clauses in both this Standard and MIS 3005-I shall apply.

11 1.4 Where the Contractor is certified against only this Standard to undertake design yet
12 contracts directly with the customer to handover a fully installed heat pump system,
13 then all clauses in this Standard shall apply and installation shall be undertaken by a
14 subcontractor certified against MIS 3005-I.

15 *Note: MCS 001-1 Clause 4.10.1 makes it a requirement that MCS Contractors shall*
16 *contract directly with the customer for the installation of a system. This is to ensure a*
17 *single point of contractual responsibility. Therefore, MCS Contractors certified against*
18 *this standard for design yet are not themselves also certified against MIS3005-I for*
19 *installation, need to appoint another contractor who is certified against MIS3005-I as its*
20 *subcontractor. In this way the MCS Contractor with the contract with the customer has*
21 *complete responsibility for the compliance of the system.*

22 *Where customers contract separately for design and installation, the arrangement is not*
23 *compliant and an MCS certificate cannot be issued.*

24 1.5 Where the Contractor is certified against only this Standard to undertake design, but not
25 contracting directly with the customer, then clauses 4 (Pre-sale information), 7
26 (Documentation & Handover) and 8 (Maintenance) do not apply.

27 *Note: In this scenario a Contractor certified against MIS 3005-I will be contracting with*
28 *the customer so responsible for complying with clauses 4, 7 and 8.*

Issue: 1.0 Draft	COPYRIGHT © The MCS Charitable Foundation 2020	MIS 3005-D
Date: XX/XX/2020		Page 8 of 29

- 29 1.6 Microgeneration heat pump systems can use different primary heat sources (ground, air,
30 and water), each of which requires different design and installation considerations. This
31 standard includes the requirements for both compression and thermally activated heat
32 pumps, as well as heat pump systems for heating only or for both heating and cooling.
33 Heat pumps may be either “Monobloc” or “Split” units.
- 34 1.7 The following are expressly excluded from this Standard:
- 35 • Cooling only systems
 - 36 • Direct expansion (DX) ground-loop systems
 - 37 • Heat pumps used for extraction of heat from loft spaces.
- 38 1.8 Reversible heat pump systems able to provide both heating and cooling are included
39 but shall be designed and optimised for heating.
- 40 1.9 For the purposes of this Standard, microgeneration heat pumps are defined as those
41 having a thermal output not exceeding 45 Kilowatt (kW_{th}) as defined by the MCS
42 Product Certification scheme document MCS 007.
- 43 1.10 Multiple MCS certified heat pumps may be used in a single installation with a total
44 design heat load of not exceeding $70kW_{th}$ (determined in accordance with BS EN
45 12831:2003) provided that no single heat pump shall exceed an output of $45kW_{th}$.
- 46 1.11 The MCS Contractor shall be assessed under one or more of the following five
47 categories of heat pump installation work:
- 48 • Ground/Water source heat pump (GSHP/WSHP) systems;
 - 49 • Air source heat pump (ASHP) systems including High Temperature (HTHP) and
50 CO_2 heat pumps;
 - 51 • Exhaust air heat pump (EAHP) systems;
 - 52 • Gas absorption and adsorption heat pump (GAHP) systems;
 - 53 • Solar assisted heat pump (SAHP) systems.
 - 54 • Domestic hot water heat pumps (DHWHP)
- 55 1.12 Hot water heat pump systems installed in accordance with this standard shall be used for
56 the provision of domestic hot water only.
- 57 1.13 The Certification Body shall identify the scope of works that the MCS Contractor wishes
58 to be registered for and undertake the assessment in accordance with this Standard
59 using the clauses relevant to the category of heat pump installation work.
- 60 1.14 MCS Contractors successfully assessed for the design of GSHP/WSHP systems are
61 deemed able to also design ASHP systems but not vice versa.

Issue: 1.0 Draft	COPYRIGHT © The MCS Charitable Foundation 2020	MIS 3005-D
Date: XX/XX/2020		Page 9 of 29

62 **2 DEFINITIONS**

63 Refer to MCS 001 for definitions.

64 **3 REQUIREMENTS OF THE MCS CONTRACTOR**

65 **3.1 CAPABILITY**

66 3.1.1 MCS Contractors shall have the competency (see Section 9) and capacity to
67 undertake the design of heat pumps Microgeneration systems.

68 **3.2 ORGANISATION**

69 3.2.1 MCS Contractors shall organise themselves using policies, procedures and systems
70 which meet the minimum requirements in MCS001 to ensure every heat pump design
71 meets this Standard.

72 *Note: MCS001 defines the requirements for "MCS Contractors" but for certification against this*
73 *standard then Designers need to meet those same requirements.*

74 *MCS001 includes requirements for Quality Management System, Customer Care, Personnel,*
75 *Continual Improvement, External Documents, Software Control, Customer Requirements,*
76 *Contracts, Subcontracting, Purchasing, Test and Measurement Equipment, Product Handling,*
77 *Training and Competence, all of which can affect the quality of installed systems.*

78 **4 PRE-SALE INFORMATION**

80 **4.1 PERFORMANCE ESTIMATION**

81 4.1.1 For domestic installations a valid Energy Performance Certificate (EPC) should be
82 used to produce an estimate of the annual energy performance of the system using
83 MCS 031: Heat Pump System Performance Estimate Template.

84 *Note: neither the annual heat energy demand of the building nor the annual energy*
85 *performance of the system are appropriate for sizing the system.*

86 4.1.2 Where it is not possible to obtain a valid EPC or it is not possible to use a SCOP (e.g.
87 GAHP, SAHP), an estimate of the annual energy performance shall be made using the
88 methodology given in Appendix B.

89 *Note: Examples of where a valid EPC would not be obtainable for this performance*
90 *estimation would be non-domestic buildings and new-build housing.*

91 4.1.3 This estimate shall be communicated to the client at or before the point that the
92 contract is awarded and accompanied by the Key Facts (Appendix D).

93 4.1.4 Additional estimates may be provided using an alternative methodology, including
94 proprietary software packages, but:

Issue: 1.0 Draft	COPYRIGHT © The MCS Charitable Foundation 2020	MIS 3005-D
Date: XX/XX/2020		Page 10 of 29

- 95 a) such estimates shall clearly describe and justify the approach taken and factors
- 96 used
- 97 b) they shall not be given greater prominence than the standard MCS estimate
- 98 c) they shall be accompanied by warning text stating that it should be treated with
- 99 caution if it is significantly better than the result given by the standard method.

100 **4.2 MINIMUM TECHNICAL INFORMATION**

101 4.2.1 As a minimum, the following technical information shall be communicated in writing to
 102 the customer at or before the point that the contract is awarded:

- 103 a) The result of the performance estimate calculated in accordance with Section
 104 **Error! Reference source not found.**
- 105 b) Manufacturer’s datasheet for the proposed heat pump
- 106 c) Manufacturer’s datasheet for the proposed hot water cylinder (if applicable)
- 107 d) Any other requirements stipulated by RECC (if applicable)
- 108 e) Details of any subcontractors proposed to undertake installation
- 109

110 **5 DESIGN**

111 **5.1 TIMESCALES**

112 5.1.1 Completion of the design of the heat pump system shall not be unduly delayed and
 113 should be complete within 60 calendar days from the day the contract is agreed.

114 **5.2 LEGISLATION**

115 5.2.1 All applicable legislation and directives must be met in full.

116 *Note: the legislation which applies may be different in England, Wales, Scotland and*
 117 *Northern Ireland.*

118 5.2.2 MCS Contractors shall ensure, and be able to demonstrate, that they are aware of all
 119 current applicable legislation.

120 5.2.3 MCS Contractors shall make their customers aware of all permissions, approvals and
 121 licences required for the installation including, but not limited to, abstraction and
 122 discharge of ground water.

123 5.2.4 For Air Source Heat Pumps, where an installation is intended to proceed with
 124 Permitted Development Rights for air source heat pumps in England, MCS 020
 125 Planning Standards must be complied with.

Commented [C1]: We would welcome suggestions, if necessary, for wording covering devolved nations.

Issue: 1.0 Draft	COPYRIGHT © The MCS Charitable Foundation 2020	MIS 3005-D
Date: XX/XX/2020		Page 11 of 29

126 5.2.5 The MCS Contractor shall ensure the building (including curtilage) is assessed by a
127 competent professional experienced in heat pump systems to ensure that it is suitable
128 for the installation and, by undertaking the proposed works, the building's compliance
129 with the Building Regulations (in particular those relating to energy efficiency) is not
130 compromised.

131 5.2.6 Suitable and sufficient risk assessments shall be conducted before any work on site
132 commences.

133 5.2.7 Where work is undertaken that is notifiable under the Building Regulations it shall be
134 made clear to the customer who shall be responsible for this notification.

135 5.2.8 The MCS Contractor shall ensure that notification under the Building Regulations has
136 been completed prior to handing over the installation.

137 *Note: Self-certification, in lieu of building control approval, is only permitted where*
138 *installation and commissioning is undertaken by a person or organisation deemed*
139 *competent and registered with a Competent Persons Scheme (CPS) approved by the*
140 *relevant government department for the scope of work being undertaken. Further*
141 *details can be found at <http://www.competentperson.co.uk>.*

142 5.2.9 The MCS Contractor shall ensure that the installation is notified to the Distribution
143 Network Operator in accordance with the procedures published by the Energy
144 Networks Association and permission sought to connect to the network in advance of
145 installation where necessary.

146 *Note: a Flow-chart detailing the ENA procedure is available from the website*
147 *www.energynetworks.org along with the process to follow for connection and*
148 *notification.*

149 5.3 MANUFACTURER'S INSTRUCTIONS

150 5.3.1 All equipment specified should be able to be installed in accordance with its
151 manufacturer's instructions.

152 5.3.2 Where the manufacturer's instructions conflict with the requirements of this Standard
153 then the requirements of this Standard take precedence unless it can be proven that
154 system performance, safety and durability are no worse than if the requirements of this
155 Standard are followed.

156 5.4 EQUIPMENT CERTIFICATION AND LISTING

157 5.4.1 The heat pump(s) specified shall be listed on the MCS website
158 (www.mcscertified.com). These listings include heat pumps both MCS certified and by
159 other schemes MCS considers equivalent.

160 5.4.2 All equipment specified:

Issue: 1.0 Draft	COPYRIGHT © The MCS Charitable Foundation 2020	MIS 3005-D
Date: XX/XX/2020		Page 12 of 29

- 161 a) Shall be fit for its purpose in the installation
 162 b) Has completed the conformity assessment process and is appropriately marked by
 163 a Notified Body in compliance with the relevant legislation.

164 *Note: for example this means the CE mark but could change as the UK leaves the*
 165 *EU.*

166 **5.5 SPACE HEATING DESIGN**

167 5.5.1 For systems delivering space heating, the following procedure shall be followed for the
 168 correct sizing and selection of a heat pump and related components for each
 169 installation:

- 170 a) A heat loss calculation should be performed on the building using internal
 171 temperatures not less than those specified in Table 1 and external temperatures
 172 specified in Table 2 column A or B, according to the MCS Contractor's assessment
 173 of the building location. If column B is selected no uplift factor for intermittent
 174 heating is required. Heat loss calculation shall in other respects comply with BS EN
 175 12831.
- 176 b) Any supplementary electric heater shall be designed to not operate above the
 177 external temperatures in Table 2.
- 178 c) When calculating the heat loss through a solid floor in contact with the ground, the
 179 temperature difference to be used is the internal design room temperature (Table
 180 1) minus the local annual average external air temperature (Appendix D).
- 181 d) When calculating the heat loss through a suspended floor, the temperature
 182 difference to be used is the internal design room temperature (Table 1) minus the
 183 design external air temperature (Table 2).

Room	Internal design temperatures (°C)
Living room	21
Dining room	21
Bedsitting room	21
Bedroom	18
Hall and landing	18
Kitchen	18
Bathroom	22
Toilet	18

185 *Table 1: Internal design temperatures taken from CIBSE*
 186 *Guide which should be consulted for data for other*
 187 *applications. CIBSE Guide A also contains information on*
 188 *how to adapt this data for non-typical levels of clothing and*
 189 *activity.*

Location	Altitude (m)	Hourly dry-bulb temperature (°C) equal to or exceeded for % of the hours in a year	
		A (99%)	B (99.6%)
Belfast	68	-1.2	-2.6
Birmingham	96	-3.4	-5.4
Cardiff	67	-1.6	-3.2
Edinburgh	35	-3.4	-5.4
Glasgow	5	-3.9	-5.9
London	25	-1.8	-3.3
Manchester	75	-2.2	-3.6
Plymouth	27	-0.2	-1.6

Table 2: Outside design temperatures for different locations in the UK taken from CIBSE Guide A, which also gives information on how to adapt and use this data.

- 190
191
192
- 193 e) A heat pump should be selected that will provide at least 100% of the calculated
194 heat loss taking into consideration the flow temperature at the heat pump and
195 without input from any supplementary electric heater. Performance data from
196 both the heat pump manufacturer and the emitter system designer should be
197 provided to support the heat pump selection.
- 198 f) An air source heat pump system should be able to maintain the internal design
199 temperatures across multiple defrost cycles.
- 200 g) Where clauses e) or f) cannot be met then clause 5.5.2 shall apply.

201 *Note: an example of where e) or f) cannot be met would be if the building has*
202 *insufficient electrical supply for the heat pump to meet 100% of the calculated*
203 *heat loss.*

204 5.5.2 Where other heat sources are available to the same building then:

- 205 a) The combined output of all heat sources shall be not less than 100% of the
206 calculated heat loss
- 207 b) All heat sources intended to supply 100% of the calculated heat loss, including the
208 heat pump, shall be fully and correctly integrated into a single control system.

209 *Note: the control system should preferably prioritise the source of heat which*
210 *causes the lowest carbon emissions.*

- 211 c) It shall be clearly stated in the contract what proportion of the building's space
212 heating and domestic hot water has been designed to be provided by the heat
213 pump (excluding any heat supplied by a supplementary electric heater) taking into
214 account the heat emitter circuit and flow rate.

215 5.5.3 The selection of High Temperature Heat Pumps (HTHPs) should be avoided unless the
216 application requires a flow rate higher than 55°C.

Issue: 1.0 Draft	COPYRIGHT © The MCS Charitable Foundation 2020	MIS 3005-D
Date: XX/XX/2020		Page 14 of 29

217 Note: Listed buildings or other design limitations may prevent the use of larger heat
218 emitters.

219 5.5.4 Where a system design proposes a flow temperature greater than 55°C, an alternative
220 design using a flow temperature of 55°C or lower should also be provided. Differences
221 to the efficiency and energy consumption of these systems shall be explained to the
222 customer allowing them to choose.

223 5.6 DOMESTIC HOT WATER DESIGN

224 5.6.1 In non-domestic buildings calculate the daily hot water demand using an appropriate
225 method accounting for building usage along with number and type of hot water
226 outlets.

Commented [C2]: We welcome comments on specific methods that may be useful for non-domestic buildings.

227 5.6.2 In domestic buildings calculate the daily hot water demand ($V_{d,average}$) using the
228 following formula:

$$V_{d,average} = 45 \times N$$

229 Where:

230 N = the greater of

- 231 a) The number of bedrooms + 1 or
- 232 b) The number of known occupants

233 5.6.3 Using the daily hot water demand and proposed heat pump heating capacity, an
234 appropriately sized hot water cylinder should be specified.

235 Note: Guidance for cylinder sizes is given in *[MGD 0XX]*. It is also acknowledged that the
236 size of cylinder may be limited by the available space.

Commented [C3]: This is a new guidance document being developed which will incorporate most of the separate heat pump guidance documents published by MCS.

237 5.6.4 The hot water cylinder specified shall be tested and labelled in accordance with the
238 HWA specification (HWA 002:2020) and compatible with the heat pump specified as:

The document including guidance on cylinder sizing is currently published with the title "Domestic HW cylinder selection guide".

239 a) Where a Class 1 cylinder, the heat pump shall be rated for a flow temperature of
240 55°C at design conditions.

241 b) Where a Class 2 cylinder, the heat pump shall be rated for a flow temperature of at
242 least that given on the cylinder label for Primary Flow temperature (T_{pfi})

243 c) Where a Class 3 cylinder, evidence that the cylinder has been tested by the heat
244 pump manufacturer whilst connected to the model of heat pump being specified.

245 5.6.5 The domestic hot water cylinder reheat time given on the cylinder label shall be agreed
246 with the customer.

247 5.6.6 Where an existing domestic hot water cylinder is used then:

- 248 a) The thermal insulation of the hot water cylinder, and all pipes connected to it, shall
249 be upgraded to a level at least equivalent to that applicable to new installations
250 under relevant legislation and guidance. For cylinders with factory applied
251

Issue: 1.0 Draft	COPYRIGHT © The MCS Charitable Foundation 2020	MIS 3005-D
Date: XX/XX/2020		Page 15 of 29

252 insulation, this condition can be satisfied if the cylinder standing heat loss is
253 certified to comply with Section 12 of BS 1566-1:2002 or equivalent. Where this
254 certification is not apparent, or where the cylinder does not have factory-applied
255 insulation, the MCS Contractor shall install additional insulation certified to comply
256 with BS 5615:1985

257 b) Proper duty of care shall be exercised to ensure that the hot water cylinder is fit for
258 purpose as regards its mechanical integrity. Consideration shall be given to scale
259 build-up affecting overall system efficiency, damage, and deterioration caused by
260 corrosion. Such issues shall be considered in the context of any additional stress
261 placed upon the cylinder through the connection of the heat pump (e.g. thermal
262 stress or additional system pressure)

263 c) Where applicable any refrigerant pipe work connecting the external evaporator
264 with the cylinder and other the heat pump components shall be secured and
265 protected in such a way that it is protected from accidental impact and escape of
266 refrigerant gas

267 d) The size of the cylinder shall comply with the heat pump manufacturer's
268 requirements

269 5.6.7 Domestic hot water systems shall incorporate a means to prevent bacterial growth
270 (including *legionella bacteria*).

271 *[NOTE: Further guidance can be found within the Health and Safety Executive*
272 *Approved Code of Practice L8 document (HSE ACoP L8).]*

273 5.6.8 Hot water heat pumps delivering domestic hot water shall use waste heat from boiler
274 rooms, waste heat from server rooms, or waste heat from external ambient air only as
275 detailed in Commission Regulation (EU) No 814/2013. The extraction of heat by the
276 heat pump shall not deplete the heat in the inhabited building space (thus increasing
277 the space heating requirement).

278 5.7 GENERAL DESIGN CONSIDERATIONS

279 5.7.1 The MCS Contractor shall ensure that the electricity supply is adequate for the size of
280 heat pump specified.

281 5.8 DESIGN OF CLOSED-LOOP GROUND HEAT EXCHANGERS

282 *Note: Designing ground heat exchangers is a complex engineering procedure. If*
283 *insufficient information is available to accurately design a ground heat exchanger, the*
284 *MCS Contractor should adopt a conservative approach.*

285 5.8.1 Closed-loop ground heat exchangers shall be designed such that the temperature of
286 the thermal transfer fluid entering the heat pump achieves a state of thermal
287 equilibrium at a temperature greater than 0°C.

Commented [C4]: Is signposting to this guidance helpful? Is there any other guidance that could also be referenced here?

Issue: 1.0 Draft	COPYRIGHT © The MCS Charitable Foundation 2020	MIS 3005-D
Date: XX/XX/2020		Page 16 of 29

288 NOTE: Thermal equilibrium is where the temperature of the thermal transfer fluid at
 289 the end of each year is the same as at the end of the previous year. The ground
 290 temperature should fully recover each year. This assumes that, where the heat pump
 291 unit is changed, it is a like-for-like replacement extracting no more heat from the
 292 ground than originally designed.

293 5.8.2 Simplified design methods, including look-up tables and nomograms, should only be
 294 used where these are location specific and have been designed to take into account
 295 UK average ground temperatures conditions, installation practices and comply with
 296 clause 5.8.1 above.

297 5.8.3 The following site characteristics shall be established using the methods or default
 298 values given in table 3:

- 299 a) average ground temperature (in °C).
- 300 b) local ground thermal conductivity (in W/mK)
- 301 c) the temperature of the thermal transfer fluid entering the heat pump

Heat Exchanger Type	Method	Default Value
Vertical Borehole	Thermo-geological assessment	???
Horizontal Collector	Soil conductivity test	???
Surface Water	Refer to CIBSE CP2: Surface water source heat pumps: Code of Practice for the UK	???

Commented [C5]: These default values are those currently published as Appendices in Issue 5 of MIS 3005.

302 Table 3

303 Notes:

304 For horizontal collectors the average ground temperature should account for the
 305 temperature swing throughout a typical year.

306 The British Geological Survey (BGS) keeps logs from a great many boreholes from all
 307 forms of drilling and site investigation work. These can be used to estimate the depth
 308 and thermal conductivity of solid geology for closed-loop borehole systems. BGS also
 309 compiles reports with information on the estimated thermal conductivity of superficial
 310 deposits for horizontal loop systems. Experienced geologists and hydro-geologists will
 311 also be able to estimate the local ground thermal conductivity. For larger systems, it
 312 may be beneficial to conduct a thermal response test. The Ground Source Heat Pump
 313 Association publication "Closed-loop vertical borehole design, installation and
 314 materials Standard" contains guidance on thermal response testing. See **MGDOXX for**
 315 **ranges of thermal conductivity for different geologies.**

316 5.8.4 The following procedure for designing the ground heat exchanger should be used
 317 unless a smaller ground loop heat exchanger can be justified through the use of
 318 proprietary software and/or ground loop replenishment through cooling or otherwise is
 319 to be implemented:

Commented [C6]: Issue 5.0 of MIS 3005 includes a threshold of 30kW above which proprietary software is required or a specialist should be consulted. Given the MCS scope of ≤70kW some argue this not necessary. We'd welcome thoughts on this particular point.

- 320 a) The total heating energy demand over a year (in kWh) for space heating and
 321 domestic hot water shall be estimated using a suitable method. The calculation
 322 shall include appropriate consideration of internal heat gains, heat gains from solar
 323 insolation, local external air temperature and the heating pattern used in the
 324 building (e.g. continuous, bi-modal, with an Economy10 tariff or otherwise).
- 325 b) The total heating energy demand calculated in clause 5.8.4 part (a) shall be divided
 326 by the heat pump heating capacity selected in clause 5.5.1 Part (e) to determine
 327 the parameter called the Full Load Equivalent (FLEQ) Run Hours:

$$\text{FLEQ Run Hours} = \frac{\text{Total Heating Energy Demand}}{\text{Heat Pump heating capacity}}$$

- 329 c) Using the Seasonal Coefficient of Performance or Seasonal Primary Energy Ratio
 330 (SCOP or SPERh) as shown on the MCS website (www.mcscertified.com) for the
 331 heat pump unit, determine the maximum power to be extracted from the ground
 332 ("G") in Watts (W) using the following formulae:

333 For electrically driven heat pumps:

$$G = H \cdot \left(1 - \frac{1}{\text{SCOP}}\right)$$

335 For gas absorption and adsorption heat pumps:

$$G = 1.1 \cdot H \cdot \left(1 - \frac{1}{\text{SPERh}}\right)$$

337 Where:

338 "H" is the HP heating capacity at 0°C ground return temperature and design
 339 emitter temperature.

- 340 d) Using tables in MGD0XX lookup the specific heat power extraction from the
 341 ground ("g") in Watts per metre (W/m) based on the type of ground heat
 342 exchanger (borehole, horizontal or slinky), the average ground temperature, the
 343 local ground thermal conductivity and the FLEQ hours.
- 344 e) Calculate the minimum length of the ground heat exchanger active elements ("L_b")
 345 in metres (m)), using the formula:

$$L_b = \frac{G}{g}$$

- 347 f) For horizontal and slinky ground heat exchangers, calculate the total ground heat
 348 exchanger area, A (in m²) using the formula:

$$A = L_b d$$

350 Where:

Issue: 1.0 Draft	COPYRIGHT © The MCS Charitable	MIS 3005-D
Date: XX/XX/2020	Foundation 2020	Page 18 of 29

351 "d" is the minimum centre-to-centre spacing of the horizontal or slinky ground
352 heat exchanger specified in the look-up tables and charts.

353 g) The minimum length of ground heat exchanger pipe in the active elements, L_p (in
354 m), is determined according to the formula:

$$L_p = L_b R_{pt}$$

355
356 Where:

357 "R_{pt}" is a non-dimensional ratio and R_{pt} = 2 for boreholes; R_{pt} = 1 for horizontal
358 ground heat exchangers; and R_{pt} is the minimum pipe length to trench length ratio
359 specified in the look-up tables and charts for slinky ground heat exchangers.

360 h) The characteristics of the ground heat exchanger active element and thermal
361 transfer fluid shall be such that the Reynolds number is ≥ 2500 at all times.

362 *Note: The look-up charts presume a Reynolds number (a measure of flow*
363 *characteristic either laminar, transitional or turbulent) greater than 2500.*

364 5.8.5 The hydraulic layout of the ground loop system shall be such that the overall closed-
365 loop ground collector system pumping power at the lowest operating temperature is
366 less than 3% of the heat pump heating capacity.

367 5.8.6 Where manufacturers' in-house software or another commercial software packages is
368 used to design the ground heat exchanger it shall be location specific taking into
369 account UK average ground temperatures, the annual heat load of the building (space
370 heating and domestic hot water) and the site characteristics established in clause 5.8.3.

371 5.9 POST-DESIGN CUSTOMER INFORMATION

372 5.9.1 Where there is a change to the agreed design and/or estimated performance of the
373 system from that given before the detailed design then customer shall be given:

- 374 a) an updated estimate of performance, in accordance with the 'MCS Heat Pump
375 System Performance Estimate'
- 376 b) a variation to contract
- 377 c) the opportunity to cancel the contract without further cost, obligation or liability.

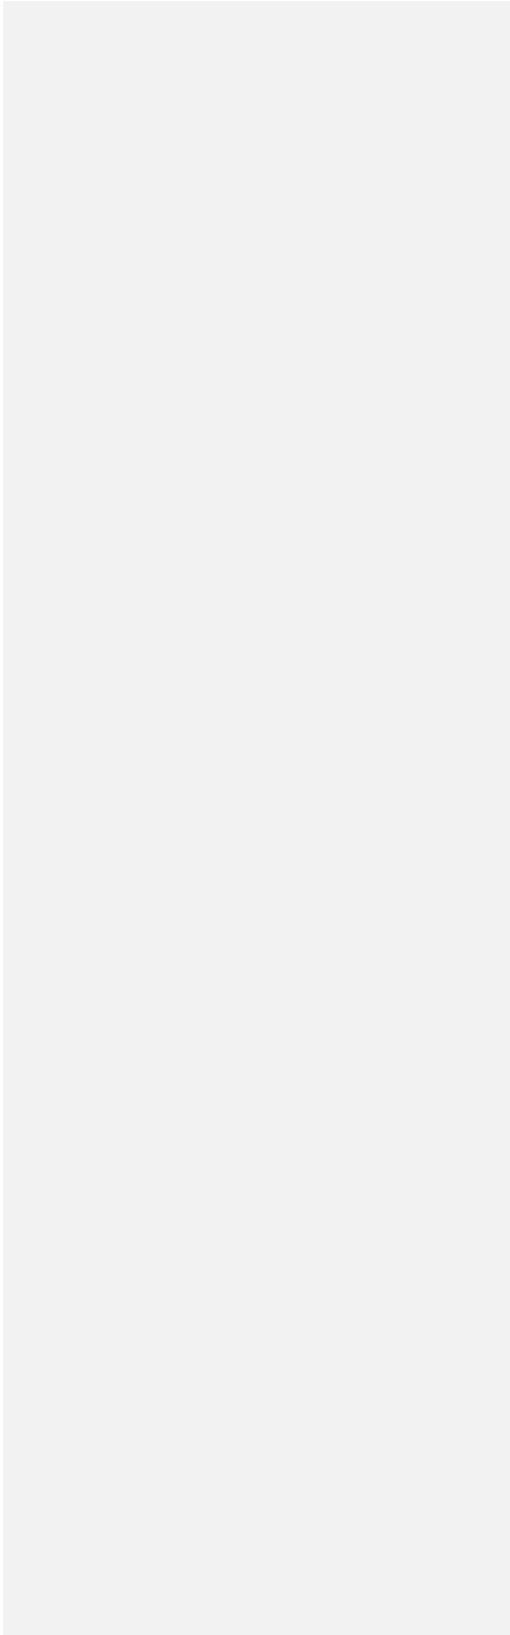

378 5.9.2 Prior to the installation commencing, the customer shall be notified in writing of:

- 379 a) all specific room heat losses (in W/m²)
380 *Note: specific heat loss is the total heat loss divided by floor area.*
- 381 b) the calculated daily hot water demand
- 382 c) the type and dimensions of emitter(s) to be used in the system.
- 383 d) the design emitter temperature based on the worst performing room.
- 384 e) the specification of any new domestic hot water cylinder and its recovery rate
- 385 f) the design flow temperature of the water leaving the heat pump and before any
386 blending valves.

Issue: 1.0 Draft	COPYRIGHT © The MCS Charitable	MIS 3005-D
Date: XX/XX/2020	Foundation 2020	Page 19 of 29

- 387 g) the installation's SCOP/SPER (as taken from the MCS website) based on the
388 above design flow temperature, when supplying space heating at the external
389 design temperature.
- 390 h) any metering that can be installed and may be required to access any financial
391 incentives.
- 392 i) a completed copy of Table 4 (if closed-loop ground heat exchanger)

395 **6 INSTALLATION & COMMISSIONING**

396 6.1 Installation and commissioning shall be in accordance with MIS 3005-I and undertaken
397 by a contractor certified against that Standard.

398 **7 DOCUMENTATION & HANDOVER**

399 **7.1 DOCUMENTATION**

400 7.1.1 The MCS Contractor shall collate a comprehensive document pack which, as a
401 minimum, includes:

- 402 • Copies of all forms and checklists used to commission the system
- 403 • The maintenance requirements and maintenance services available
- 404 • Manufacturer user manuals and warranty details.
- 405 • Any documentation or checklists required for any incentive schemes

406 **7.2 HANDOVER**

407 7.2.1 At the point at which the heat pump system is handed over to the customer, the
408 documentation as detailed in 7.1.1 shall be provided and explained along with a
409 document signed by the MCS Contractor containing at least the following:

- 410 • A declaration, signed by the MCS Contractor's on-site representative, confirming
411 that the installation meets the requirements of this Standard
- 412 • Client name and address
- 413 • Site address (if different)
- 414 • MCS Contractor's name, address, contact details etc.
- 415 • List of the key components installed
- 416 • The estimation of system performance calculated according to Section 4
- 417 • Recommended interval for the first periodic inspection
- 418 • MCS contact details (helpline telephone number and email address)

419 7.2.2 No later than 10 working days after commissioning, the installation shall be registered
420 by the MCS Contractor on the MCS Installation Database (MID) and an MCS
421 Certificate generated.

422 7.2.3 The MCS Certificate shall be sent to the customer with instruction to include it within
423 the handover pack.

Issue: 1.0 Draft	COPYRIGHT © The MCS Charitable Foundation 2020	MIS 3005-D
Date: XX/XX/2020		Page 22 of 29

424 7.2.4 The generation of the certificate shall be undertaken in full compliance with the terms
425 and conditions of use of the MID¹ and the registration of the system on the MID shall
426 be undertaken only after the system has been fully installed and commissioned and not
427 before.

428 7.2.5 A “per installation” fee is levied on MCS Contractors for each registration added to the
429 database. Details of any such fee will be advised from time to time through MCS
430 Certification Bodies.

431 8 MAINTENANCE

432 8.1 System design should allow safe access of all components necessary for commissioning
433 and maintenance.

434 8.2 For recommended maintenance requirements see MIS 3005-1?

435 9 ROLES & COMPETENCY

436 9.1 All personnel involved in the design and installation of heat pump systems either
437 employed by, or subcontracted to, the MCS Contractor shall be competent or
438 instructed for the activities they undertake.

439 9.2 For two or multi-piece split systems, personnel shall be appropriately qualified for the
440 handling of refrigerants e.g. EU F-GAS regulations, the Fluorinated Greenhouse Gases
441 Regulations and Gas Safe.

442 9.3 Complete records of training (where appropriate) and competence skills of personnel
443 shall be maintained by the MCS Contractor, in particular:

- 444 • Design personnel - Shall be able to demonstrate a thorough technical knowledge
445 of the technologies involved and the interaction of associated technologies and be
446 able to deliver a compliant design to the requirements of this Standard.
- 447 • Installation personnel – Shall be able to demonstrate an adequate level of technical
448 knowledge and installation skills, to install systems to the specified design in
449 accordance with the requirements of this standard, applicable codes of practice,
450 manufacturer’s instructions and Statutory Regulations.

451 *Note: As a minimum MCS Contractors should have personnel with demonstrable*
452 *training and / or experience of heat pump systems in accordance with the*
453 *requirements of this Standard. Entry level qualifications as shown in Appendix A, may*
454 *be deemed as suitable for simple non-complex systems.*

¹ The terms and conditions of use can be found on the MCS Installation Database website.

455

456 10 REGIONAL OFFICES

457 Where the MCS Contractor wishes to design and commission under the Certification Scheme
458 in regional offices, then these offices shall meet the requirements of this standard to be eligible
459 for Certification.

460 11 PUBLICATIONS, REFERENCE AND FURTHER 461 READING

462 11.1.1 The below lists are provided so that MCS Contractors know which documents have
463 been used as a basis for the development of the requirements of this MIS standard and
464 they are able to further research topics if they need to do so.

465 11.1.2 It is a scheme requirement for MCS Contractors to own or have immediate access to at
466 least one copy of the following documents in each office or regional office undertaking
467 design, installation and commissioning work:

- 468 • MIS 3005 – D
- 469 • MIS 3005 - I
- 470 • MGD OXX - MCS - Heat Pump Guidance Document

Commented [C7]: This document is in progress and is simply a consolidation of all those already published.

471 11.1.3 It is not a scheme requirement for MCS Contractors to own or have immediate access
472 to the following documents unless this MIS standard does not adequately cover off the
473 aspects required.

- 474 • BS 7671:2018 Requirements for Electrical Installations (IET Wiring Regulations Eighteenth
475 Edition). Available from British Standards Institution (BSI):

532 APPENDIX B – PERFORMANCE ESTIMATION
533 METHOD

534

535 For all systems where the premises are not entitled to obtain a domestic EPC (e.g. non-
536 domestic) as defined in clause 4.1.2 or where it is not possible to use a SCOP (e.g. GAHP,
537 SAHP), the means of estimating the annual energy performance shall be as follows:

538 a) Assess the annual heat load for the building (space heating and / or hot water) using
539 any suitable performance calculation method. Such calculation method shall be clearly
540 described and justified.

541 b) Multiply the result from a) by the proportion of the relevant heat load provided by the
542 heat pump system as determined in accordance with Clause 5.5.2.

543 c) For space heating, divide the result from b) by the default efficiency (expressed as a
544 Seasonal Coefficient of Performance or Seasonal Primary Energy Ratio (SCOP or
545 SPERh)) for heat pumps calculated using the data available on the MCS website
546 (www.microgenerationcertification.org). For water heating, divide the result from b) by
547 the efficiency (expressed as a Seasonal Coefficient of Performance or Seasonal Primary
548 Energy Ratio (SCOP or SPERh)) when the heat pump is operating at the flow
549 temperature of the heat pump while providing water heating service.

550 d) For Domestic Hot Water (SAHPs and HWHPs), the efficiency to be expressed as a
551 Seasonal Performance Factor (SPF) shall be taken as the Coefficient of Performance
552 (COP) (in accordance with the SEPAMO report: D2.5/D3.5 Position paper on heat
553 pump SPF) obtained from the test results undertaken as part of the MCS 007 heat
554 pump product certification scheme requirements for SAHPs and HWHPs.

555 e) Calculate the energy supplied by the auxiliary heater by multiplying the result from a)
556 by the proportion of the relevant heat load not supplied by the Heat Pump.

557 f) Add the result from c) to the result from d) to give the total energy required for the
558 relevant heat load.

559 g) The results from e) for space heating and hot water are added together to give an
560 overall energy requirement for the building for these heat loads.

Issue: 1.0 Draft	COPYRIGHT © The MCS Charitable Foundation 2020	MIS 3005-D
Date: XX/XX/2020		Page 27 of 29

561 APPENDIX C – KEY FACTS

562 **The performance of microgeneration heat pump systems is impossible to predict with**
563 **certainty due to the variables discussed here and their subsequent effect on both heat**
564 **supply and demand. Your estimate is given as guidance only and should not be considered**
565 **as a guarantee.**

566

567 Seasonal Coefficient of Performance:

568 MCS Seasonal Coefficient of Performance (SCoP) is derived from the EU ErP labelling
569 requirements, and is a theoretical indication of the anticipated efficiency of a heat pump over a
570 whole year using standard (i.e. not local) climate data for 3 locations in Europe. It is used to
571 compare the relative performance of heat pumps under fixed conditions and indicates the
572 units of total heat energy generated (output) for each unit of electricity consumed (input). As a
573 guide, a heat pump with a MCS SCoP of 3 indicates that 3 kWh of heat energy would be
574 generated for every 1 kWh of electrical energy it consumes over a 'standard' annual cycle.

575 Energy Performance Certificate

576 An Energy Performance Certificate (EPC) is produced in accordance with a methodology
577 approved by the government. As with all such calculations, it relies on the accuracy of the
578 information input. Some of this information, such as the insulating and air tightness properties
579 of the building may have to be assumed and this can affect the final figures significantly
580 leading to uncertainty especially with irregular or unusual buildings.

581 Identifying the uncertainties of energy predictions for heating systems

582 We have identified 3 key types of factor that can affect how much energy a heating system will
583 consume and how much energy it will deliver into a home. These are 'Fixed', 'Variable' and
584 'Random'. Most factors are common to ALL heating systems regardless of the type (e.g oil, gas,
585 solid fuel, heat pump etc.) although the degree of effect varies between different types of
586 heating system as given in the following table.

587 The combined effect of these factors on energy consumption and the running costs makes
588 overall predictions difficult however an accuracy $\pm 25-30\%$ would not be unreasonable in many
589 instances. Under some conditions even this could be exceeded (e.g. considerable opening of
590 windows). Therefore it is advised that when making choices based on mainly financial criteria
591 (e.g. payback based on capital cost verses net benefits such as fuel savings and financial
592 incentives) this variability is taken into account as it could extend paybacks well beyond the
593 period of any incentives received, intended occupancy period, finance agreement period etc.

594

Issue: 1.0 Draft	COPYRIGHT © The MCS Charitable Foundation 2020	MIS 3005-D
Date: XX/XX/2020		Page 28 of 29

Factor	Impact
'Fixed' which include:	
Equipment Selection Performance figures (SCoP) from ErP data	System Efficiency
Energy Assessment via the EPC (e.g. assumptions as to fabric construction and levels of insulation; the variation in knowledge and experience of Energy Assessors)	Energy Required
'Variable' which are affected by the system design and include:	
Accuracy of sizing of heat pump- i.e. closeness of unit output selection (kW) to demand heat requirement (kW)	System Efficiency
Design space and ambient (external) temperatures	Energy Required
Design flow /return water temperatures, and weather compensation	System Efficiency
Type of Heat emitter (e.g. Under-floor; natural convector (e.g. 'radiator'), fan convector etc.)	System Efficiency
'Random' which cannot be anticipated and include:	
User behaviour:	
• Room temperature settings	Energy Required
• Hot water usage and temperature settings	Energy Required
• Occupancy patterns/times	Energy Required
• Changing the design HP flow temperatures	System Efficiency
• Ventilation (i.e. opening windows)	Energy Required
Annual climatic variations (i.e. warmer and colder years than average)	Energy Required

595

596 Key:

597 The statement at the end of each item indicates the major factor affected as follows:

598 Energy Required: the heat energy output requirement of the system which directly impacts
599 on running costs. This requirement exists regardless of the heating system
600 chosen as it is the heat required to keep the space comfortable. Opening
601 windows or increasing room temperatures will demand more heat output,
602 which means more energy input but this would NOT directly affect the
603 efficiency. Thus increased energy demand does NOT automatically mean
604 reduced efficiency.

605 System Efficiency: the efficiency of the system has been directly affected and will therefore
606 demand more input energy to achieve the same heat output thus
607 increasing running costs. However, increased energy input does NOT
608 necessarily mean lower system efficiency (see above).
